

Configuration Reference

Below are the canonical configuration fragments. The `pre` blocks preserve every space and newline exactly as written - indentation matters for the YAML parser, so the engine must not re-wrap or strip it.

Use `--check-config` to validate the file before applying it, and `--reload` to apply changes without a restart. The reload path writes a marker file that the supervisor watches.

Long single-line commands and log lines also stay on one line inside a `pre` block; the example below fits the content width.
