

Facility Operations Manual

Document FM-2024-01 · Revision B

This manual is divided into four sections. Each section starts on a new page because the layout engine honors page-break-before: always .

1. Shift handover

The outgoing shift logs every intervention in the shift book, including unresolved alarms and open work orders. The incoming shift verifies the log within the first thirty minutes.

2. Weekly inspection

The weekly inspection covers the hydraulic unit, the compressor room, and the roof drainage. Inspections are recorded in the maintenance system with photographs.

3. Emergency response

In case of an emergency the operator follows the response matrix on the control room wall and calls the duty number first, then the site security desk. The fire alarm drill runs every quarter.

4. Documentation & forms

All forms are available from the document server under /operations/forms. Paper copies are stored in the archive room, shelf D. binders 14 to 21.
